

ADISION by REKTINA

Product Concept, Business Model & MVP Documentation

Positioning: Community Advertising Marketplace

Launch Focus: WhatsApp Groups and Channels

Mark of Authenticity: The official ADISION wordmark displayed on this cover and used as the product's visual authenticity mark.

1. Executive Summary

ADISION by REKTINA is a community advertising marketplace designed to connect advertisers with active digital communities.

The platform enables businesses, founders, brands and individuals to distribute advertisements through verified WhatsApp Groups and Channels while allowing community owners to earn revenue from their audiences.

Instead of an advertiser individually searching for WhatsApp groups, negotiating prices with multiple administrators, sending payments manually and having little visibility into results, ADISION creates one central marketplace.

Core model: Advertiser creates a campaign → ADISION matches the campaign with relevant communities → Community Partners publish the campaign → Performance is tracked → Community Partners earn.

2. The Problem

Community advertising is fragmented. Advertisers often search manually for relevant groups, negotiate separately with administrators, make multiple payments and have no reliable way to confirm placement or compare performance.

At the same time, community owners may have valuable audiences but lack a structured, trusted system for monetizing those audiences.

ADISION solves both sides by creating a managed marketplace with campaign workflows, verification, tracking and earnings.

3. The ADISION Solution

For advertisers: create campaigns, define the audience, choose duration or package, upload creative assets, pay through one platform and monitor campaign progress.

For Community Partners: register communities, complete verification, receive relevant campaigns, accept assignments, publish adverts, submit proof and earn through an ADISION wallet.

For ADISION: manage verification, campaign approval, distribution, scoring, proof review, fraud control, earnings and payouts.

4. Core Vision

ADISION should not be positioned merely as a website for posting adverts in WhatsApp groups.

The larger vision is a **performance-driven marketplace for advertising through online communities**. WhatsApp is the first distribution channel, while the product architecture should support future expansion into Telegram, Discord, Facebook Groups, campus communities, creator communities, newsletters and other audience networks.

The principle remains: Advertisers need audiences. Communities have audiences. ADISION connects both sides and measures performance.

5. Target Users

Advertisers: small businesses, startups, VTU platforms, e-commerce businesses, event organizers, job platforms, real-estate businesses, educational platforms, fintech products, mobile apps, local businesses and creators.

Community Partners: owners or administrators of WhatsApp Groups and Channels. The MVP may use a minimum eligibility requirement such as 500 members or followers, while recognizing that activity and reliability are more important than raw size alone.

ADISION Administrators: review communities, approve campaigns, assign distribution, verify proof, manage disputes and payouts, and monitor quality and fraud.

6. Marketplace Model

Layer 1 — Community Supply: Community owners register WhatsApp Groups or Channels and submit details such as name, link, type, category, audience, size, location and verification evidence. Status: Submitted → Under Review → Verified or Rejected.

Layer 2 — Advertising Demand: Advertisers create campaigns containing a name, copy, media, destination link, call-to-action, audience, category, duration and budget or package.

Layer 3 — Distribution & Performance: ADISION identifies relevant communities, assigns campaigns, receives acceptance, tracks placement and links, verifies proof and credits earnings.

7. MVP Scope

The MVP should prove one core question: **Will advertisers pay to reach verified communities, and can ADISION reliably distribute and measure those campaigns?**

Version 1 should therefore prioritize a controlled marketplace over complex automation.

8. MVP Features

Public Website: explain the platform with two main paths — Advertise with ADISION and Earn with Your Community. Include how it works, benefits, categories, pricing approach, FAQs and calls to action.

Authentication: email or phone registration, password login, OTP verification, password recovery and profile management. Account roles should include Advertiser and Community Partner, with future support for one account having both capabilities.

Community Dashboard: show registered communities, status, available campaigns, active campaigns, pending earnings, available balance, total earnings and performance score.

Add Community: name, WhatsApp link, Group or Channel type, category, member/follower count, description, audience, location and screenshot or verification evidence.

Community Categories: Students & Campus, Business, Technology, Crypto/Web3, Jobs & Opportunities, Entertainment, Fashion & Lifestyle, Sports, General and Local Communities.

Advertiser Dashboard: create campaigns, upload copy and media, add destination links and CTAs, define audience/category, choose duration or package, pay and monitor progress.

Campaign Review: campaigns move through Draft → Submitted → Under Review → Approved/Rejected → Active → Completed/Closed.

Campaign Distribution: ADISION matches campaigns based on category, audience, size, activity, reliability and previous performance. MVP assignment can be semi-automatic and controlled by administrators.

Unique Tracking Links: each community receives a unique campaign URL so ADISION can compare clicks, unique clicks and placement performance.

Proof of Placement: Assigned → Accepted → Published → Proof Submitted → Verified → Earnings Credited.

Wallet: Pending Earnings, Available Balance, Total Earned and Transaction History. Withdrawals can initially be requested by the user and processed by an administrator.

Admin Console: manage users, communities, campaigns, assignments, proof, wallet transactions, withdrawals, disputes, scoring and platform analytics.

9. Community Performance Score

ADISION's long-term differentiation should be its ability to identify communities that actually perform.

A simple MVP score can combine: **Reliability (40%)** — completion of assigned campaigns; **Activity (30%)** — verified activity signals and administrator review; and **Campaign Performance (30%)** — tracked clicks and measurable outcomes.

Higher-performing communities may receive priority access to premium campaigns and stronger earning opportunities.

10. Campaign Pricing & Earnings Logic

For the MVP, use simple packages rather than a complex real-time auction.

Illustrative example: an advertiser purchases a 7-day campaign for █7,000. ADISION records the full payment, deducts its platform commission according to the configured business rule, reserves the remaining distributable pool and allocates earnings to participating Community Partners after successful verification.

The exact percentages should be configurable by administrators rather than hard-coded.

11. Recommended User Flows

Community Partner: Sign Up → Add Community → Submit Verification → Admin Approval → Eligible for Campaigns → Receive Assignment → Accept → Publish → Submit Proof → Verification → Wallet Credit.

Advertiser: Sign Up → Create Campaign → Select Audience and Duration/Package → Upload Creative → Pay → Review → Community Assignment → Campaign Live → Track Results → Campaign Completion.

12. MVP Exclusions

Do not delay launch by building: automatic WhatsApp posting, advanced AI campaign generation, real-time WhatsApp analytics, Telegram/Discord integrations, ad auctions, advanced fraud AI, self-selection of individual communities, automated bidding, complex referral systems or subscription plans.

These belong to later versions after the marketplace model has been validated.

13. Product Architecture Principles

The technical architecture should separate **Users, Communities, Campaigns, Campaign Assignments, Tracking Links, Proof Records, Scores, Wallets, Ledger Transactions and Withdrawals**.

WhatsApp should be treated as the first **distribution channel**, not the entire identity of the platform. This allows ADISION to expand without redesigning its core business model.

14. Suggested MVP Success Metrics

Track: number of registered communities, verified communities, active advertisers, campaigns created, campaign completion rate, assignment acceptance rate, proof approval rate, clicks per campaign, top-performing communities, advertiser repeat rate, Community Partner earnings, platform revenue and payout volume.

15. Development Priority

Phase A — Foundation: authentication, roles, profiles, public website and admin access.

Phase B — Supply: community registration, verification and community management.

Phase C — Demand: campaign creation, campaign review, packages/payment integration and campaign management.

Phase D — Distribution: assignments, acceptance, campaign instructions, unique links and proof submission.

Phase E — Money & Intelligence: wallet ledger, earnings, withdrawals, basic scoring and analytics.

16. Brand & Mark of Authenticity

The supplied ADISION wordmark is the official **Mark of Authenticity** for this concept.

The product should consistently be presented as **ADISION by REKTINA**. ADISION has its own product identity, while REKTINA provides the parent ecosystem and brand endorsement.

Recommended presentation: **ADISION**
by REKTINA

Suggested positioning line: **Reach the right communities.**

17. Final Product Statement

ADISION by REKTINA is a community advertising marketplace that connects advertisers with verified and active communities, enabling businesses to reach relevant audiences while allowing community owners to earn from the audiences they have built.

The MVP begins with WhatsApp Groups and Channels. The long-term opportunity is a broader performance-driven infrastructure for advertising through communities across multiple digital platforms.

ADISION by REKTINA

A performance-driven community advertising marketplace.
